Over 400 GW of new generation capacity is expected in 2026 China's installed solar power capacity is set to surpass coal for the first time in 2026. According to the 2025-2026 National Power ...

The resulting surge in new capacity means that solar is poised to overtake wind this year - and hydro this year or next - to become the largest source of clean power generation in China.

The massive growth in wind and solar begs the question: why is China still building coal power plants and, by most analyses, way more than it actually needs? The answer is complicated.

While some point to China's continued construction of flexible coal fired power plants (designed to balance VRE), they ignore that China's imported oil use in transport probably peaked in 2024, a decade ahead of ...

A large part of the solar power capacity installed in China is in the form of large PV power plants in the west of the country, an area much less populated than the eastern part but with better solar resources and available ...

This report is Ember's first comprehensive review of China's clean energy progress and its implications for the rest of the world, undertaken because of China's centrality to the global transition.

China installed a record 315 GW (AC) of new solar capacity in 2025, lifting cumulative installed PV capacity to 1.2 TW and pushing non-fossil power sources past thermal generation for the first time.

China's solar energy production is reaching simply staggering levels, dragging energy costs down around the globe.

Wind and solar power surpassed thermal power in terms of installed capacity for the first time ever in the first quarter of last year. As of March. 31, 2025, China's installed capacity of wind and solar power ...

China's solar air power generation

Overview Solar photovoltaics History Solar resources Concentrated solar power Solar water heating Effects on the global solar power industry Government incentives As of at least 2024, China has one third of the world's installed solar panel capacity and is the largest domestic market for solar panels. A large part of the solar power capacity installed in China is in the form of large PV power plants in the west of the country, an area much less populated than the eastern part but with better solar resources and available land.

China is adding more solar and wind power to its energy grid than any other economy - but that huge buildout has its challenges. Here's what we can learn
