The key components of a cooling system are the cooling fan, cooling pump, radiator, engine block, thermostat, and coolant. The thermostat helps maintain the operating temperature by circulating ...

Schematic diagram of the generator cooling system and end-winding region.

In air-cooling systems, the engine takes cool air from the atmosphere and blows it internally across the different parts of the generator set. This keeps the generator from overheating.

Ventilation - The generator installation, especially an inside location, requires adequate ventilation in order to provide sufficient air for cooling, combustion, and removal of radiated heat from the generator ...

the manufacturer had to consider the same airflow requirements for indoor applications. This information sheet discusses the design requirements for generator system enclosures, the different types of ...
