-----  
What are the codes for a generator exhaust system?

National Protection Association Code Numbers 99 and 100 are important codes that cover generator exhaust systems. The designer should also consult all applicable local codes. = Backpressure in psi = Length of pipe in ft = Exhaust gas flow ft<sup>3</sup>/min = Inside diameter of pipe inches = Specific weight of gas lb/ft<sup>3</sup>

What factors should be considered in the design of a exhaust system?

a: The designer of the system should also consider the exhaust factors in the design: Water in the system- Water can be a by-product of exhaust and enter the system as ra

What is a generator design & construction chapter?

This chapter focuses on the design and construction of the generator and its major individual components. It goes into enough detail on how the components are designed and fabricated, to assist the reader in maintaining them. The chapter discusses issues that significantly influence the design of the various generator components.

How do you design a gas exhaust system?

The following should be undertaken: The designer, having the manufacture's data for gas flow (ft<sup>3</sup>/min) and maximum back pressure, uses a chart (see diagram two for details) to determine the inside diameter of the pipe. The exhaust system should be designed as short as possible with a minimum of bends.
