Features of the load duration curves for Kosovo's Electricity System has went through constant changes, both in terms of proportional growth but also in terms of load factor change.

This paper discusses aspects of re-design of loadshedding schemes with respect to actual developments in the Kosovo power system. Load-shedding is a type of emergency control that is designed to ensure system ...

We urge citizens, where possible, to use alternative heating sources such as wood or pellets and to shift their electricity consumption to after midnight," the announcement concludes.

Therefore the recommendation for the System Operator of Kosovo is to adopt 6 steps, $6 \times 8 = 48\%$ load shed UFLS program, which fully complies with ENTSO-E requirements.

This paper presents a review of the existing UFLS (Under Frequency Load Shedding) program in compliance with recently revised Police-5 of Operational Handbook of ENTSO-e.

Kosovo should switch to load shifting if it wants to change its power consumption during peak time and avoid expensive imports, a new study...

This paper presents a new adaptive load-shedding scheme that provides emergency protection against excess frequency decline, in cases when the Kosovo power system might be disconnected from the regional ...

Kosovo should switch to load shifting if it wants to change its power consumption during peak time and avoid expensive imports, a new study shows.
